CUTTING DIES

“CLEAR CUT RESULTS”

Diecut Smaller Trim with Less Pressure

TrimSaver™ was developed by Proden as a solution to reduce trim size; however, the surprising and greater results was being able to run with less pressure resulting in longer die life, longer anvil life and better waste management.

Because the TrimSaver™ system requires less pressure, there is no need for additional support behind the lead knife. Running with less pressure will also provide a more consistent creasing profile.

TrimSaver™ can be used with standard size trim and has proven to run with trim sizes as small as 1/16” (1.5 mm) with no issues. If there is any reservation

about your diecutter holding close registration through your press, the option for “Side Trim Only” is also available. Since side trim is generally the chop off the corrugator, this is a true savings with no adverse risk.

This patented innovation has been licensed within the North American market to all the Inspirere Innovations members.
